

Abstracts

Abstracts from other Journals, chosen for importance and timeliness, are published in the *Journal* from time to time. The greater number of these abstracts are translations, chiefly from the U.S.S.R., and made available by the Research Laboratories of Eastman Kodak Company.

The subject areas are grouped below

- High-Speed Photography and Instrumentation
 - History
 - Printing and Optics
 - Projection
- Sensitometry and Image Structure
- Sound Recording and Reproduction
- Television

HIGH-SPEED PHOTOGRAPHY AND INSTRUMENTATION

The "Time Microscope" (in Russian), Alecdandru, Marin, Engineer, *Stinta si Tehnica*, No. 9, 22-23, 1961. EA VI, 3/62.

The author briefly describes slow-motion photography and various cameras used for it. The conventional motion-picture cameras can be used only for a maximum speed of 200 to 300 frames/sec. For industrial or scientific purposes, however, considerably higher speeds may be ob-

tained by special devices or cameras. A speed of up to 40,000 frames/sec can be achieved by a continuous motion of the film and by using optical compensation of the film motion. The 16mm Soviet SKS-1 cine camera is used for frequencies of 150 to 4,000 frames/sec, whereas the ZLI cine camera made in the GDR can be used for 18 by 22-mm frames at frequencies of 250 to 2,000 frames/sec. By reducing the size of the frames to 4 by 4.5 mm, the ZLI camera can make 40,000 frames/sec, using a 35mm film. Drum-type cine cameras, with or without optical compensation, can make 18 by 24-mm frames at 5,000 frames/sec. By reducing the height of the frames to 8 mm each, drum-type cameras with optical compensation achieved a speed of 100,000 frames/sec. Very high speed may be obtained by a system of "optical commutation," where the film stands while the successive images of the subject "sweep" the film surface. The Soviet SFP camera has a filming frequency of 2,500,000 frames/sec, each frame being 5 by 5 mm. The method of decomposing the images into small surfaces distributed on the photosensitive film according to a given "code" makes it possible to increase the filming speed to 100 million frames/sec. However, this high-speed photography requires very good lighting. Some other difficulties are due to the synchronization between the runoff of the photographed phenomena and the

operation of the cine cameras. Synchronization may be achieved by electronic-optical, electromechanical, acoustical and electrothermal devices, controlled by the photographed action, which release the camera and the lighting system.

The Use of the SKS-7 Camera as a Streak Camera (in Russian), S. M. Provornov, O. S. Grebenikov and V. P. Grusev, *Zhur. Nauch. i Priklad. Fot. i Kinemat.*, 6: No. 5, 386-388, Sept.-Oct. 1961.

Alterations have been made to a Soviet-made SKS-1 high-speed camera so as to adapt it for streak photography. The optical compensator was removed and the objective was replaced by a special optical system. In its modified form the camera has a time resolution of 3 by 10⁸ mm/sec.—S.C.G.

International Congress on High-Speed Photography and Cinematography (General Review) (in Russian), A. A. Sakharov, *Zhur. Nauch. i Priklad. Fot., i Kinemat.* 6: 457-462, Nov.-Dec. 1961.

In September, 1962, the 6th International Congress on High-Speed Photography and Cinematography is to be held in Holland, practically ten years after the holding of the first congress. Those congresses which have been held to date are discussed from the point of view of the

Acceptance of the MOVIOLA CRAB DOLLY for motion picture and television cameras is world wide as evidenced by unsolicited testimonials.

Users have learned through experience that the Moviola Crab Dolly provides a mobile platform for their camera that can be precisely positioned with more facility and speed, and with greater accuracy than any other type of camera support.

Regardless of the shot — moving or static — all people engaged in the creative phases of the industry recognize that production values are enhanced by the use of the Moviola Crab Dolly.

PRODUCERS see additional set-ups and more fluid camera work resulting in a quality product even on a tight budget.

DIRECTORS can add the dimension of camera movement to their sequences and, through continuous composition, give dramatic force to their story.

CAMERAMEN are able to "roll-in" on tight shots, exploit lighting setups to greater advantage, match "takes" to rehearsals through faithful dolly tracking and re-position quickly by smooth precision adjustment.

EDITORS welcome "dailies" that have an infinite variety of shots and added coverage. These values provided by the Moviola Crab Dolly eliminate "choppy" continuity caused by limited set-ups on ordinary camera supports.

for **HIGH** production value . . . on a **LOW** budget

WRITERS see that the Moviola Crab Dolly broadens their scope in its use for dramatic effects.

You can break the stalemate of production values versus cost with the help of the Moviola Crab Dolly. Call or write now for a free brochure.

Scaled for portability!

There's not an excess ounce anywhere on the Arriflex 16... because this professional motion picture camera was designed to **handy** proportions. When you film with it, your hand can be as quick as your eye. It's a classic achievement in portability!

Yet it embodies today's most desired and widely imitated motion picture camera feature—the **Arriflex mirror-reflex shutter**. What's more, it is the only professional camera under \$2,000 with a **registration-pin film movement**. It is part of a precision-engineered system—which includes interchangeable magazines, sound blimps, motors, time-lapse and other special-purpose equipment.

Here's how the Arriflex 16 earns its lightweight title. The basic camera, 5 lbs. 14 oz. Add a variable-speed electric motor, and you've added only 20 ounces. Complete with three typical lenses, the ready-to-film Arriflex outfit scales just over 8 lbs. It travels light and compact in the Arriflex 16 "A" case, designed to fit under your airplane seat... to save you waiting time and freight charges. It's a true money-saving **portable!**

Pick up an ARRIFLEX®16 today
...it's no effort with one hand!

ARRIFLEX CORPORATION OF AMERICA • 257 PARK AVENUE SOUTH, NEW YORK 10, N. Y.

mode of publication of the proceedings, the nationality of the participants, organizations (i.e., universities, research institutes, industrial laboratories, etc.) presenting papers and the subject matter of the papers. The analysis is displayed in tabular form.—S.C.G.

High-Speed Camera, E. A. Tarantov and A. M. Petrov, Avt. sv. SSSR, cl. 57a, 61, No. 135756, 15.02.60. 20 Zh 110 Patent *Referat. Zhur.*

Proposes a high-speed cine camera in which a rotating mirror is used with a double coating and at a small distance between the reflecting surface and the axis of rotation to increase the probability of recording a process taking place during somewhat less than one frame in mirror systems.

The Ballistic Camera Pinpoints a Missile in Space, Northrop Corporation product circular. Special purpose cameras: high-speed cameras; tracking system, NSS 26, printed Aug. 1961.

The Nortronic Ballistic Camera has an $f/2$ lens with a 600-mm focal length and a high-speed between-the-lens, louvre-type shutter with a 12-in. aperture; it can record the exact trajectory of missiles and aircraft by photographing attached strobe lights against a star background. The angular accuracy achieved is one part in 200,000, and with proper geometry the same linear accuracy is possible, e.g., a

missile 1000 miles out in space can be located within 26 ft, and it can be used for calibrating electronic tracking instruments. pulsing will allow several cameras to be used for sequential exposure along a ballistic path. After alignment, the lens elements, the largest of which is nearly 15 in. in diameter, are fastened rigidly with a strain-free technique which, under normal conditions, maintains factory alignment indefinitely; the iris is remotely controlled by a servo loop with an integral motor driving the iris diaphragm. This ballistic camera is reported to be the largest camera in the world.—M.B.K.

HISTORY

The 89th Conference of the American Society of Motion-Picture and Television Engineers in Toronto (Canada) (in Russian), V. G. Komar and M. Z. Vysotskiĭ. *Tekh. Kino i Televideniya*, 5: 51-55, Sept. 1961.

The proceedings of the Society's Conference held in Toronto from May 7 to 12, 1961, are summarized.—S.C.G.

Aleksandr Fedorovich Shorin (in Russian), E. Goldovskii, *Kinomekhanik*, 34-37, Dec. 1961.

Shorin (1890-1941) was a Russian inventor who played a large part in the development of the sound cinema in the Soviet Union. His life is briefly outlined and his methods of photographic recording and reproduction of sound are described.

PRINTING AND OPTICS

Systems of Optical Compensation Using Rotating Prisms (in Russian), M. Vechera, *Tekh. Kino i Televideniya*, 5: 59-61, Nov. 1961.

In a rotating-prism system of optical compensation in a film camera with continuous film transport, the image deviates from its correct position in the frame because the relation between the angle of rotation of the prism and the position of the image is not linear. Two methods of overcoming this difficulty are described. In the first the prism is in two wedge-shaped parts, one of which is moved to and fro along the axis of the rotating member by a cam mechanism in such a way that the optical thickness of the total prism varies so as to compensate for the nonlinearity. The second makes use of a Cardan coupling between the electric motor drive and the compensating prism, the geometry being so arranged that retardations and accelerations are introduced into the rotation of the prism so as to correct for the incomplete compensation—S.C.G.

A Method and Device for Obtaining Anamorphic Images without Anamorphic Optics (in Russian), I. Cerny, *Tekh. Kino i Televideniya*, 5: 12-17, Oct. 1961.

A simple method is described for obtaining a compressed image of, for example, a chart for testing wide-screen projection. The original is first photographed at an angle which will give a

TYPE 92B PLAYBACK SYNCHRONIZER FOR SYNCHRONIZATION OF 1/4" TAPE IN PLAYBACK WITH SPROCKET DRIVEN FILM

Responsible for tape to film transfer? Check out this addition to the distinguished MTE line of synchronizing equipment. You'll find no other gives you all of the 92B's important benefits:

WIDE RANGE, can correct speed deviations of +20% to -20% from sync speed.

CONTINUOUS DISPLAY OF SYNC CONDITION so user knows exactly whether tape is in sync. Oscilloscope semi-circle pattern moving clockwise indicates tape speed fast, counter-clockwise indicates tape speed slow, semi-circle standing still indicates precise sync speed. In addition, Comparator-driven dial registers % deviation from 7 1/2 or 15 i.p.s. normal speed.

SYNC SIGNAL LEVEL IS INDICATED BY VU METER, an Attenuator provides for boosting weak signals 20 DB. Also a Volt Meter indicates voltage to capstan motor.

HAS MEMORY if sync signal is lost, tape runs at last sync-controlled speed.

ADVANCING OR RETARDING TAPE TO LIP-SYNCHRONISM with picture, when screening, is achieved with a Spinner Knob Framing Control

VERSATILE REMOTE CONTROLS for operating tape recorder at the Synchronizer are incorporated.

FULLY AUTOMATIC. Choice of automatic speed control for sync transfer work or manual speed control for special effects, pitch change, trimming time spots, etc.

COMPACT. All solid state. Entire 92B unit mounts in 12 1/4" of rack space, weighs 38 lbs.

COMPATIBLE. Can be used with tape transports including Ampex 350, 351, 354, 300, 400, and others. Uses 60 cycles or 14KC control track supplied by MTE type 87, 88, or any other control track generators, or sync head.

ECONOMICAL. High utility in film studios, music studios, in-plant film production facilities. Solid state reliability eliminates maintenance. Only \$1,920.00

REFLEX EXCLUSIVE* BY CECO

NOW ENJOY ALL THE
ADVANTAGES OF REFLEX
SHOOTING WITH AN EYEMO,
MITCHELL OR
BELL & HOWELL STANDARD CAMERA

REFLEX SHOOTING of any subject is sure and certain, as every cameraman knows. Because you see the actual image formed by the taking lens itself, there's no doubt about focus, depth of field or freedom from parallax error; and no need to rack-over the camera. Today, after years of intensive research, development and testing, CECO has perfected a unique Optical System* worthy of these fine cameras. Many CECO-converted units have already been tried and proven in major film productions.

ALL CECO CONVERSIONS include a full (silent) film gate aperture and ground glass, and a removable academy (sound) matte in the finder system. A TV frame with center cross is etched on the ground glass. The image viewed is magnified about ten times in the Eyemo — ten and twenty times in the Mitchells and Bell & Howell Model 2709. Under most shooting conditions, no exposure compensation is necessary — yet the image you view is clear and bright even when the lens is stopped down substantially.

For full details on this great new advancement, stop in and see us, if possible — we'll be delighted to discuss it personally. Otherwise, please write us for data, literature, and prices.

EYEMO.

If you own this excellent instrument, in its standard 100-ft. capacity, spring-wound form, we can convert it to full reflex operation at reasonable cost. Or we can supply the entire camera, complete with CECO conversion. We can also supply it equipped for external magazines and motor, as well as the reflex conversion.

MITCHELL 35mm. Standard, Standard Hi Speed, or NC, with either single lens without turret, or with 4-lens turret, are all equally adaptable to CECO conversion — the ultimate refinement of superb professional equipment!

BELL & HOWELL 35mm.

MODEL 2709 can be equipped with the CECO reflex conversion.

Reflex conversions can also be made to many other cameras.

lateral compression but introduce perspective distortion. The photographic image so obtained is rephotographed at an angle but in such a way that the lateral compression is increased while the perspective distortion in the opposite sense cancels the first distortion. In the simplest form of the method the angle used is 45° , when the single lateral depression is $\sqrt{2}$ and the total compression is 2. This and more difficult cases involving other compression ratios are analyzed mathematically. A simple stand is described in which the angle of the original being copied and the camera distance can be quickly adjusted.—S.C.G.

Apochromatic Taking Objectives for the Trick Cine Camera TKS-3, M. M. Rusinov and M. I. Kuz'mina, Avt. sv. SSSR, cl. 42h, 4/20, No. 134468, 25.12.60.

Discusses patented objectives (50mm and 35mm $f/2.3$) used in the TKS-3 camera for making double exposure 35mm cine pictures in the visible and infrared by the method of wandering masks with a beam splitter. The objectives provide accurate register of the images in the visible and infrared parts of the spectrum and the correction of secondary chromatism. The components of the objective are of special flint, for example OF-3; and between a negative meniscus and an inner positive

component is located a plano-parallel corrector with chromatic radii, consisting of three components of special flint OF-3 or dense crown, for example TK-9.

PROJECTION

Reduction of the Distortions of Motion-Picture Images with Separate Projection of Parts of the Frame onto a Concave Screen (in Russian), E. M. Goldovskii, *Tekh. Kino i Televideniya*, 5: 22-28, Sept. 1961.

The mode of formation of distortions in motion-picture projection onto curved screens is discussed and a number of methods of reducing them are considered. Particular attention is paid to systems in which the middle and sides of the scene are recorded on separate areas of the film and are projected separately.—S.C.G.

Selenium Rectifiers for Motion-Picture Arc Power Supplies (in Russian), A. Sukhov, *Kinomekhanik*, 16-19, Dec. 1961.

Silicon Rectifiers for Motion-Picture Arc Power Supplies (in Russian), Harrow Abstracts, 1962. V. Il'in, I. Oskolkov and L. Sazhin, *Kinomekhanik*, 20-24, Dec. 1961.

A Photoelectric Brightness Meter (in Russian), S. A. Drukker, *Svetotekhnika*, 7: No. 7, 10, 1961.

The general principles of construction of objective brightness meters, optical systems of brightness meters, radiation receivers and photocurrent amplifiers are discussed. The main points of the YaKP-1 brightness meter made by NIKFI, designed for the measurement of the brightness of motion-picture screens, are discussed.—S.C.G.

Eliminating Rewinding (in Russian), A. Bodrov, V. Petrov and L. Fonar', *Kinomekhanik*, 35-38, Oct. 1961.

In the system of motion-picture projection described, rewinding of the film after showing is avoided by means of a new type of film spool. The film is not wound onto a central core but onto a removable spring hoop on a flat disk plate. When the spool is used in the feed position it is placed on a horizontal turntable on top of the projector, the central hoop is removed and the film is withdrawn from the center of the spool. It is taken up on a spool of the same type and is ready for immediate re-use without rewinding.—S.C.G.

The Uniformity of Illumination of Screens and the Useful Light Flux of a Motion-Picture Projector. (Notes on the Gost Draft Standard on Motion-Picture Projectors for 35 and 70mm Films) (in Russian), E. M. Goldovskii, *Tekh. Kino i Televideniya*, 5: 70-72, Oct. 1961.

Variations in screen illumination due to horizontal and vertical angles of projection and to screen curvature are analyzed. In the draft standard it is stated that the useful light flux is taken as the product of the average illumination of the screen and its area. This is true only for a flat screen. The case of the curved screen is treated mathematically.—S.C.G.

THE SIMILARITY ENDS HERE . . .

Rental fees are pretty much the same everywhere. But there is a difference in rental service. There is the personality behind the rental service . . . engendered by the friendliness, the interest in making your project a success, and the guidance in providing you with the right equipment. There is also the integrity behind the rental service you use . . . that promise is equated with performance . . . that substitution does not entitle one to absolution . . . that when the term "finest quality" is used, it should not be used loosely . . . but should adhere to the standard the words imply. The next time you rent motion picture equipment, ask yourself this question: "Am I getting these things from the company I do business with?"

You are sure of getting all these things when you call

IN CANADA: ASSOCIATED SCREEN INDUSTRIES, Ltd. 2000 Northcliffe Ave., Montreal, Can.

The Fusion of Flicker in Motion-Picture Projection (in Russian), E. Goldovskii, *Kinomekhanik*, 21-29, Sept. 1961.

The conditions under which flicker due to periodically interrupted illumination of a surface becomes noticeable to the viewer are discussed. The influence of the interruption on the apparent brightness, the critical frequency for the disappearance of flicker, the influence of shutter design on critical frequency, the critical frequency, in different types of projection and methods of increasing shutter frequency are dealt with.—S.C.G.

The Problem of the Tolerances in Vertical Parallax in the Viewing of Stereo Motion-Picture Films (in Russian), A. N. Shatskaya, *Tekh. Kino i Televideniya* 5: 57-65, Oct. 1961.

An analysis is made of the factors causing vertical parallax in cinematography and projection, the limits of their influence are determined, methods and results of an experimental determination of the tolerances in the value of the vertical parallaxes and their differences in observation of the stereo image on the screen are described and ways of preventing the development of intolerable values of parallax are mentioned.—S.C.G.

The Czechoslovak AM-8 Amateur 8mm Motion-Picture Projector with Automatic Loading, J. Stanek, *Tekh. Kino i Televideniya*, 5: 85-87, Oct. 1961.

The AM-8 camera made by the Meopta Factory is described. A special feature is

the automatic loading, and a synchronizer for a tape-recorder is provided as accessory. A magnetic-tape instrument, made especially for use with the projector, is available. In use it fits under the projector.—S.C.G.

New 8mm Motion-Picture Projectors (in Russian), V. G. Pell', *Tekh. Kino i Televideniya*, 5: 81-85, Oct. 1961.

A review of recent 8mm motion-picture projectors is based on publications concerning the Photokino Exhibition of 1960.—S.C.G.

Automaton Device for Motion-Picture Projection (in Russian), *Kinomekhanik*, No. 8, 30-34, 1961.

A device is used for either conventional or wide-screen systems, but the film magazines and projection lamps are inserted manually.

SENSITOMETRY AND IMAGE STRUCTURE

Dependence of the Quality of a Motion-Picture Image on the Process by which It Has Been Obtained (in Russian), I. B. Blyumberg, T. M. Zyazina and G. I. Teregulov, *Tekh. Kino i Televideniya*, 5: 19-24, Nov. 1961.

In earlier papers changes in picture quality were studied by means of a series of optical or contact prints. The techniques have now been applied to evaluate the changes in picture quality (graininess

and sharpness) as a picture goes through the several stages by which a release print is obtained. A number of different routes are possible in practice, and several of these are analyzed, the values of the picture quality parameters being tabulated for each stage.—S.C.G.

Electron Optical Transducers and Image Intensifiers in Cinematography (in Russian), N. I. Tel'nov, *Tekh. Kino i Televideniya*, 5: 74-82, Sept. 1961.

Foreign (i.e., non-Soviet) literature on electronic image intensifiers is reviewed. (33 references).—S.C.G.

SOUND RECORDING AND REPRODUCTION

An Adhesive Tape for Editing Magnetic Sound Tracks and Wide-Screen Film Prints (in Russian), A. P. Pletnev and S. Kh. Nazarov, *Tekh. Kino i Televideniya*, 5: 65-68, Nov. 1961.

A new adhesive tape for quickly splicing together magnetic soundtracks or wide-screen film prints in editing has been made by the chemical factory at Shostka, U.S.S.R. The results of laboratory tests on the physical properties of the film are set out.—S.C.G.

The "Sinkrofon" Apparatus for Synchronized Projection of 8mm Sound Motion-Picture Films (in Russian), L. B. Neronskii, *Tekh. Kino i Televideniya*, 5: 64-73, Sept. 1961.

of construction of an apparatus for synchronizing a soundtrack on magnetic tape with an 8-mm projector. Control is afforded by signals on a second track of the tape.—S.C.G.

Improvement of the Method of Separate Processing of Soundtracks on Color Motion-Picture Films (in Russian), S. E. Tikhonovich and L. S. Sevast'yanova, *Tekh. Kino i Televideniya*, 5: 18-21, Oct. 1961.

Improved formulas have been worked out for viscous developers for the separate development of soundtracks on color motion-picture film. With smaller concentrations of Metol and hydroquinone than in an earlier formula, they have better keeping

properties. In one of them ethylenediamine is used to replace the alcohol in the original formula.—S.C.G.

Magnetic Tape Type 6-35 (in Russian), S. Kh. Nazarov, N. G. Korzhukov, A. P. Pletnev and O. N. Yakovlev, *Tekh. Kino i Televideniya*, 5: 7-11, Oct. 1961.

Type 6-35 is a new Soviet 35mm magnetic tape made to replace earlier types which had poor demagnetization properties, thus limiting their repeated use. The new tape has better recording properties and its magnetic properties are less sensitive to temperature changes.—S.C.G.

The Directional Characteristics of Sound Sources in Sound Reproduction (in Russian), B. F. Natarov, *Tekh. Kino i Televideniya*, 5: 32-34, Dec. 1961.

Negative Feedback in Amplifiers for the Sound Cinema (in Russian), A. Sukhev, *Kinomekhanik*, 38-42, Sept. 1961.

Apparatus and Methods of Synchronization of an Unperforated Sound Carrier. Analysis of Existing Methods of Synchronization of an Unperforated Sound Carrier (in Russian), Yu. G. Chizhevskii, *Tekh. Kino i Televideniya*, 5: 5-13, Nov. 1961.

To increase the reliability of the control channel and also to improve the quality of the main recording, it is advantageous to use the counterphase method of recording the control signal. In working with unsynchronized cameras, the emitter of the control signal should preferably be placed on the sound recorder and synchronization should be made on the camera. This gives the possibility of raising the

quality of recording the control signal and of working with a number of cameras. From the point of view of economy, convenience and reliability, the system of synchronized copying of magnetic soundtracks from 6.25mm tape onto perforated film is preferably carried out on the principle of the closed tracking system, using tracking either by phase or by frequency.—S.C.G.

Apparatus and Methods of Synchronization of an Unperforated Sound Carrier (in Russian), Yu. G. Chizhevskii, *Tekh. Kino i Televideniya*, 5: 22-29, Oct. 1961.

Devices used in cinematography and television for the synchronization of an unperforated sound carrier are considered; methods of recording the control signal and synchronized copying with a 6.25mm carrier on unperforated tape are analyzed; and recommendations are given for the construction of synchronization systems.—S.C.G.

The Dynamic Range of Photographic Soundtracks (in Russian), A. A. Yur'ev, *Tekh. Kino i Televideniya*, 5: 28-30, Sept. 1961.

An earlier formula for the calculation of the dynamic range of a photographic soundtrack is criticized, and a more accurate expression for the "possible" dynamic range is derived; this is compared with the "real" dynamic range. The effect of noiseless recording on the real dynamic range of a soundtrack is considered. It is concluded that for a new variable-area soundtrack the real dynamic range lies in the range of 30 to 35 db and depends only a little on the degree of noise reduction, which with the aid of the usual noiseless recording systems can easily reach 45 to 50 db. However, from this it does not follow that the noise elimination on the soundtrack need only be slight. During use the track will pick up a considerable amount of noise which begins to have an effect if the degree of sound elimination is insufficient. With a poor noiseless-recording level, the noise of a used film can increase to such a degree that it will decrease the real dynamic range of a track which even without it would be insufficient. Hence the noise elimination in making the soundtrack should be as great as possible, leading to a degree of noise reduction of 55 to 65 db.—S.C.G.

TELEVISION

Design of a Group of Plug-In Television Studio Amplifiers, K. J. Austin, *BBC Engineering Div. Monograph*, No. 41, Apr. 1962.

The monograph considers the basic operational requirements of some of the amplifiers which are used in large numbers in the television broadcasting studios and transmission network. The mechanical form of the amplifiers, which use a plug-in arrangement, is described in detail. The electrical design of the most commonly used amplifier, the video distribution amplifier, is fully described, and details of its performance, together with that of two other amplifiers are given.

Off-The-Shelf Delivery!
**IMAGE-ORTHICON,
VIDICON LENSES**

Rent or Buy Image Orthicon Lenses from World's Greatest Selection . . . choose from 28mm focal length to 60" . . . delivered right "Off-The-Shelf" at B & J World's Lens Headquarters!

Here you'll find the lens you need for practically ALL T.V. Cameras, R.C.A. (TK-41, TK-11); G. E. Black and white or color; Du Mont, etc.! Rely on the Industry's Prime Optics-Source . . . Pioneers in T.V. Optics Since 1936 and currently serving such stations as WGN, WNBQ, ETC.

Our Instrument Shops and "Know-how" offer you Special Mountings, Calibration and Custom Fittings! (Also Cine & Slide Equipment for your News Dept.)

FREE NEW, DEFINITIVE BROCHURE ON SCOTCH® BRAND MAGNETIC FILMS

including sections on splicing techniques, film erasure, cleaning, handling and storage

Here is complete and authoritative information on "SCOTCH" BRAND Magnetic Films for the motion picture and television engineer who wants to know more about his sound medium. This FREE booklet is a handsome, full-color piece . . . lists complete properties and quality standards of all "SCOTCH" BRAND Magnetic Films, plus "inside track" information on magnetic film splicing techniques, erasure, cleaning, handling and storage, etc. No film engineer should be without a copy of this authoritative guide to magnetic films. Use the coupon at right to send for yours—FREE—today!

TWO TOP "SCOTCH" BRAND MAGNETIC FILMS FOR 16mm. RECORDING!

No. 316 . . . a standard oxide film, the professional standard the world over for 16mm. sound excellence. Its uniformity, dynamic range, freedom from distortion, provide top quality for original recordings and

subsequent re-recordings. Widely used for news pickups, industrial and educational filming and television.

No. 326 . . . a High Output Oxide film, offers the same quality recording advantages as No. 316. However, it provides greater output with increased signal-to-noise ratio, and more than adequate protection against overloads.

3M also makes "SCOTCH" BRAND films in 35mm. and 17 $\frac{1}{2}$ mm. sizes, as well as a complete line of splicing tapes, described fully in the free illustrated brochure.

A Test of Video Tape to Film in Educational TV

By REID H. RAY,
JOSEPH T. McDERMOTT
and WAYNE A. MAYER

Educational TV stations have a problem of economically producing program material available within their area. This paper briefly outlines the methods used to produce, with portable-type equipment, three half-hour programs and the transfer of the edited video-tape material to 16mm projection prints.

EDUCATIONAL television stations operate on extremely small budgets in comparison to their commercial brothers; therefore, cost is an important factor in producing programs. These programs are made available to the other educational stations throughout the United States. As one of the 57 educational television stations, KTCA-TV, Twin City Area Educational Television Corp., St. Paul, Minn., desired to produce several programs featuring the world-renowned St. Olaf College Choir.

Dr. Olaf C. Christiansen, the choir's Director, was eager to cooperate but was concerned as to the recording location, since acoustical excellence was an important factor. The Chapel on the campus of St. Olaf College, 40 miles from the studios of KTCA-TV, seemed an ideal choice. Other recordings and live broadcasts had already originated from this Chapel.

As is the case with many educational stations, no motion-picture cameras are owned by KTCA-TV; however, a truck equipped for remote pickups, complete with camera chains, audio equipment and accessories, is a part of the station's equipment. At the time, early 1961, KTCA-TV did not yet own a portable video-tape recorder; therefore an arrangement was worked out with WTCN-TV, one of the commercial stations in the Minneapolis-St. Paul area, for the loan of a mobile Ampex Videotape Recorder and truck.

Two trucks with the portable video-tape recorder, television cameras and lighting equipment were driven to the location early in the morning. The temperature was about 10° F, so there was some concern over dimensional changes in the video tape. However, by

Presented on October 6, 1961, at the Society's Convention at Lake Placid, N.Y., by Reid H. Ray (who presented the paper), Reid H. Ray Film Industries, 2269 Ford Pkwy, St. Paul 16, Minn., and Joseph T. McDermott and Wayne A. Mayer, KTCA-TV, St. Paul, Minn. (This paper was received on July 11, 1962.)
