# YOU CAN SEE THE FUTURE BY LOOKING AT US NOW.

While industry talk invariably revolves around new technologies, it takes a very special Company to stay focused on the creative product and capital investment you've already made.

Panasonic is making significant refinements to existing technology and developing major new products such as its half-inch 4:2:2 videotape recording system currently under development. All Panasonic products share the same vision: a commitment to value, quality, and technological continuity.

Each Panasonic system, whether it's S-VHS, EnHanced MII or D-3, has cameras, dockable recorders, field portable recorders and studio VTRs; with high quality bridges between formats.

RS-232C interfaces have been added to

key VHS and S-VHS VCRs to extend their applications in edit environments. The new EnHanced Series MII has a forward-looking 16:9 video capability built-in, and includes a Studio VTR with a Digital Output for interfacing to CCIR 601 or D-3 composite digital domains. D-3 VTRs now

have a Digital Format Converter, so D-3 can work easily with component digital sources or destinations.

Thus, it should come as no surprise that when Panasonic debuts its half-inch 4:2:2 recording system in 1993, it will play back D-3 recorded tapes in composite or component.

Now, when you choose a videotape recording system, think about where you're headed and how Panasonic can help get you there.

## SMPTTE Advanced Television and Electronic Imaging Conference New York, N.Y., February 4 - 5, 1993

The Annual SMPTE Advanced Television and Electronic Imaging Conference will be held February 4 to 5, 1993, at the Sheraton Hotel and Towers in New York City, it was announced by Editorial Vice-President Frank Haney, Fox Television Stations. Dean M. Winkler, Post Perfect, Inc., has been appointed program chairman.

The conference, "Computer Graphics for Film and Television," will cover such pertinent issues as image compositing, advanced digital video formats, desktop computers for broadcast video and motion pictures, and electronic imaging in feature films. Paper presentations during the

two-day event are expected to explore such topics as resolution-independent video, video compression, interconnecting computers and digital video devices via fiber-optic links, scanning film into high-resolution digital video, creating graphics with desktop computers, and computer-graphic shape interpolation. In addition, plans for two panel discussions to be held during the conference are in the works.

"Clearly, by the end of this decade, there will be no distinction between computer devices and video devices," said Winkler. "This conference is designed to help introduce the world of computer graphics to the television

and motion-picture engineering communities."

To assist him in his conference duties, Winkler has appointed several people to the conference's program committee, including Roland Brown, The Moving Picture Co.; Neil Feldman, Video Post and Transfer; Laurin Herr, Pacific Interface; Robert Murch, WPIX-TV, Alex Seiden, Industrial Light and Magic; and Laurence Thaler, NBC.

Papers that are selected for the conference will be compiled and published in a book that will be sold at the conference. Additional conference information will continue to be published in the *Journal*.
