

The world's first miniaturized 10-bit broadcast deck with 6G-SDI, dual SD card recorders, FTP upload and more!

The miniaturized design of HyperDeck Studio Mini puts powerful professional grade deck features into a compact size that can go anywhere! You get 6G-SDI for working with all formats up to 2160p30, dual SD card recorders, ethernet for FTP media uploading and familiar VTR style controls. Use it to record and archive worship services and church events, or take advantage of unique features that make it perfect for driving massive multi screen projectors, digital signs and much more!

Broadcast Quality

HyperDeck Studio Mini can record full 10 bit broadcast quality files using standard ProRes and DNx formats. That means you get files that look great and are compatible with everything! HyperDeck Studio Mini features two mirrored SDI outputs that can also be used to play back RGBA ProRes files up to 1080p60 for sending animated broadcast graphics with fill and key to a live switcher!

Record to High Speed SD Cards

Now you can record onto inexpensive and easy to buy SD cards! 720 and 1080 HD video can be recorded onto regular SD cards, while Ultra HD can be recorded using high performance UHS-II cards. The cards are solid state so you get instantaneous transport ballistics and never have to wait for media to cue! SD cards let you create an archival library that takes up a fraction of the space required by older media!

Non Stop Recording

HyperDeck Studio Mini features dual SD card recorders for non stop recording. When the recording card becomes full, it automatically continues onto the next card. That means you'll never have to worry about missing an important shot! The cards are also hot swappable, so you can swap out a full card for an empty one while recording continues in the other slot!

Professional Connections

Advanced 6G-SDI connections let you work with all equipment and formats up to 2160p30. You get an SDI input, reference input and output with built in sync generator, and two SDI outs that can be mirrored or used for separate fill and key channels. The HDMI connection can be used to playback on big screen TV's, plus there's also RS-422, ethernet for FTP upload of files and a built in power supply.
